

Individual report week 6

This week the focus has been to make some “nice to have features” such as removing the top toolbar and changing the app logo and loading screen icon. But the sprint also contained a breakthrough in getting the Heroku cloud database working. Therefore, we also integrated a function for the cloud and local database to communicate. The local database asks the cloud if there is a new version of inserts to fetch and fetches these updates if available. However, this feature broke the way you should work with scrum since this was not planned for the sprint and you can argue it brings zero value to the user end of the app since it is more a nice feature for the administration. This sprint I have contributed towards the loading icon change and the communication of the local and cloud database. I have learnt a lot this week about threads and databases so in that sense I consider this my best sprint. For next week I will keep being active and support the team when we are now entering the end phase of this project.
