

Individual report week 1

Summary

This week we had an introduction to working with scrum including some exercises and formed groups for the upcoming code project. We also created a repository and agreed upon a social contract.

Reflections

During the exercise build a Lego city I noticed that our group forgot in all the excitement in the planning phase to use the effort estimation cards and thereby forgetting an important part when working with scrum. Another thing observed during this week was the complexity to work like a team involving everyone in the different phases. My individual goal for the course is to really embrace the working methods of agile software development and bring the experience into my future career and contribute to the team by approaching a problem like I don't know the answer but will help to tackle it in the best way according to my knowledge and experience. Which leads me into the next point how I will contribute to the team use of scrum, and it is to be available, listen to other members and deliver my part of the sprint in time according to our planning. The last reflection "to deliver my part of the sprint in time" is what I consider important for the contribution to the team deliveries, but it is also to be as mentioned available to help the rest of the team if we notice someone is falling behind the time schedule because that is what I would expect from other team members if I were falling behind. I consider the golden rule to sum it up in a good way, "treat others as you would want them to treat you".
